## **Early Hearing Detection Intervention (EHDI) Program:**

### **What is the Data Telling Us?**

Hearing impairments in infants can negatively impact speech and language development, academic achievement, and social and emotional development if left undetected. These negative impacts can be reduced through early intervention. There are three goals of the EHDI Program:

- All newborns will be screened for hearing loss before 1 month of age, preferably before hospital discharge.
- All infants who screen positive will have a diagnostic audiologic evaluation before three months of age.
- All infants diagnosed with a hearing loss will receive appropriate early intervention services before 6 months of age.

The South Dakota Department of Health recently evaluated 2010-2015 EHDI data to identify weaknesses in the surveillance program in order to identify where to focus efforts for program improvement.

### **Screening Data**

Between 2010 and 2015, the percent of South Dakota births that have been screened has been stable at about 98%. Of the infants who have been screened, the percent screened before one month of age has ranged from a low of 97.9% in 2015 to a high of 98.4% in 2013. In order to improve the percent screened, it is important to know the reasons for not being screened.

The main reason for not being screened was ‘unavoidable’ (infant death, infant transferred and no documentation of screening, non-resident, unable to be screened due to medical reasons, and parents/family declined services). The figure on the following page summarizes the reasons for not being screened over time and shows that the number of infants in the missed or unknown category have decreased over time. In 2015, additional categories were added, and home birth is the second largest category with missing screening data.

## Reasons for Not Being Screened

\* Beginning in 2015 there is no longer a 'missed' category. Additional categories were added (home birth, parent unresponsive, unable to contact), including an 'unknown' category.

^ Unavoidable reasons include deaths, transfers, non-residents, medically unable, and parents declined.

## Numbers of Home Births, South Dakota Residents, 2006-2016

Due to the relatively large number of home births that were not screened in 2015, the number of home births historically was determined. As shown in the graph to the left, there has been an increase home births from a low of 25 in 2006 to a high of 98 in 2015. These data indicate that one way to improve the percent of infants screened is to increase screening, or collection of screening data, among home births.

## Diagnostic Data

Infants are considered as 'lost to follow-up' if the parents were contacted but unresponsive, families were unable to be contacted, or if their status was considered unknown. Although the percent of infants who failed the screening and were lost to follow-up has decreased since 2011, it is still high with 61.9% of infants who failed screening being considered as lost to follow-up in 2015. This compares to a national lost to follow-up rate of 27.9%.

## Percent of Infants Who Did Not Pass Screening that were Lost to Follow-up\*

If an infant fails the screening, the goal is to have a diagnostic evaluation prior to three months of age. As shown below, the percent of infants with no diagnostic data has decreased from 93.9% in 2011 to 74.0% in 2015, but it is still *high*. The percent of infants who are screened after three months of age has been increasing from 1.8% in 2011 to 5.9% in 2015. Means to reduce the percent of infants with no diagnostic data need to be identified and there needs to be an increased effort to complete the diagnostic evaluation prior to three months of age.

### Diagnostic Status of Those Who Did Not Pass Screening

In order to reduce the number of infants with no diagnostic data, it is important to know reasons for the lack of data. In 2015, the top reasons why infants were lost to follow-up included parents that were unable to be contacted and parents that were unresponsive. Decreasing these numbers will improve the coverage of EHDI.

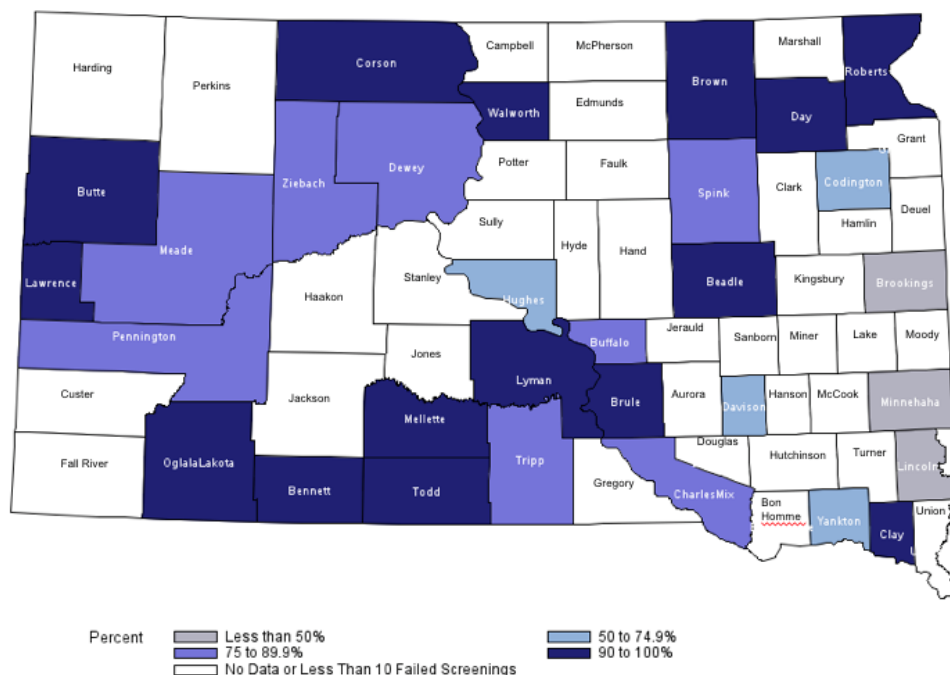

### Reasons for No Diagnostic Data Among Infants Who Failed Screening

^ Unavoidable reasons include deaths, non-resident, parents declined, healthcare provider did not refer, unable due to medical reasons or in process.

Knowing where the infants who fail a screening but have no diagnostic data reside will help when determining which counties to focus on to insure that these infants are receiving diagnostic evaluations. It will be important to determine whether the infants in these counties are not receiving a diagnostic evaluation or whether the evaluations are not being reported.

**Percent of Infants Who Failed Screening That Did Not Receive Diagnostic Evaluation by County of Residence, South Dakota, 2011-2015**  
**Only Counties with At Least 10 Infants Who Failed Screening are Shown**

## **Intervention Data**

The majority of infants have no intervention data. Because the intervention program is administered through the Department of Education, this information cannot be released without the parent's consent due to Family Educational Rights and Privacy Act of 1974. Increasing the number of consents obtained from parents of infants either at the time of screening or at the audiology exam should improve the surveillance of early intervention.

## **Summary**

Based on 2010-2015 EHDI data, the following approaches should improve the surveillance data of the EHDI Program.

### ***Screening:***

Identify methods to improve screening and submission of screening data of home births.

### ***Diagnostic Data:***

Decrease the number of infants who are lost to follow-up.

Improve the percentage of infants who have diagnostic evaluations completed prior to 3 months of age.

Improve the reporting of diagnostic evaluations.

### ***Intervention:***

Increase the percentage of infants for whom parental consent is obtained at the time of screening or diagnostic evaluation.

## **South Dakota Pregnancy Risk Assessment Monitoring System (PRAMS)**

The Pregnancy Risk Assessment Monitoring System (PRAMS) was developed by the Centers for Disease Control and Prevention (CDC) in 1987 and is done in collaboration with various state health departments. PRAMS is a statewide survey that collects valuable information from new mothers on behaviors and attitudes before, during and after pregnancy to find out why some babies are born healthy and others are not. Currently, 47 states, New York City, Puerto Rico, the District of Columbia and the Great Plains Tribal Chairmen's Health Board (GPTCHB) participate in the PRAMS survey, representing approximately 83% of all U.S. live births. The Ethel Austin Martin Program at South Dakota State University, in partnership with the South Dakota Department of Health, conducted South Dakota PRAMS-like surveys in 2014 and 2016, and is currently conducting the CDC-sponsored PRAMS with the Department of Health, which began in 2017.

The PRAMS survey results provide state agencies and the CDC with data, so they can monitor changes in maternal and child health indicators such as the prevalence of unintended pregnancy, prenatal care, breastfeeding, and smoking and drinking behaviors. PRAMS data can be used to identify groups of women and children who are at high risk for health problems and to measure the progress of goals that are developed to improve the health of women and children. PRAMS data also can be used by researchers to investigate emerging issues of maternal and child health and by state and local governments to design, review or help plan maternal and child health programs and policies.

In 2007, a South Dakota Tribal PRAMS (SDT PRAMS) was conducted by the Great Plains Tribal Chairmen's Health Board and the Northern Plains Tribal Epidemiology Center. It was the first PRAMS run by a tribe and focused on maternal and health data for the American Indian population. In 2017, CDC funded a South Dakota Tribal PRAMS that is collecting data from American Indian mothers from four South Dakota tribes (Crow Creek Sioux Tribe, Flandreau Sioux Tribe, Sisseton Wahpeton Oyate and Standing Rock Sioux Tribe) who gave birth in 2017. In comparison, the SD PRAMS is collecting data statewide on all races for at least the next three years. The ultimate goal of both surveys is to improve the health of future mothers and children.

### **How is a PRAMS conducted?**

The PRAMS survey is organized as a questionnaire in a booklet format. The questionnaire itself has gone through many modifications since its original development by the CDC in 1987. It is composed of two parts, the CDC's core questions and pre-tested standard questions. The core portion is required from all states and contains questions about a mother's attitudes and feelings during her most recent pregnancy, the content of her prenatal care, maternal alcohol and tobacco consumption, physical abuse before and during pregnancy, contraceptive use and knowledge of pregnancy-related health issues. In addition to the core questions, states can also choose from a standard list of 185 pre-tested questions or develop their own state-specific questions.

The standard questions either provide additional information on core topics or address other topics such as social support, mental health and injury prevention. South Dakota PRAMS selected 83 standard and core questions and added 10 adverse childhood experience questions to better understand how a mother's childhood experiences may affect pregnancy or birth outcomes. The entire survey takes about 25 minutes to complete.

Each month a random sample of mothers who delivered a baby who would be about two months of age at the time of sampling is obtained, and the mothers are asked to complete the survey. The sample is pulled from South Dakota's birth certificate file, and the total annual sample size will include about 1,800 women. For confidentiality purposes, at no time is a name associated with the individual survey results. The South Dakota 2017 PRAMS was completed in June of 2018, and the South Dakota 2018 PRAMS sampling began in March of 2019.

In order to obtain sufficient numbers within different race categories, American Indian mothers and mothers of other races are oversampled. For example, we will be sampling about 600 births in each of the three race categories (White, American Indian, other races) each year, which will require about 8% of White mothers, 35% of American Indian mothers, and 40% of mothers of other races being sampled. The random sample should be representative of South Dakota births, but some exclusions are applied. Births that occur to South Dakota residents out-of-state and those that occur in-state to non-residents are excluded. Also excluded are adopted and surrogate births and births for which the birth certificate is processed more than six months after birth. For multiple births, only one sibling is randomly chosen.

As with all surveys, it is important to have a high response rate. A high response rate ensures that the data reflect South Dakota mothers and to get the best overall picture of maternal and child health in the state. Per CDC protocol, the randomly selected women are first contacted by mail with a letter that introduces the PRAMS survey and notes that a questionnaire will follow in the near future. Three to seven days later, a questionnaire packet is mailed. It contains a cover letter that describes the PRAMS study, encourages participation and explains how to fill out and return the survey. The packet also includes the PRAMS questionnaire booklet, a self-addressed pre-paid return envelope, a brochure that provides additional information about the PRAMS survey, and a cash incentive as a thank you for participation. If the mother does not respond, two more packets will be sent before the mothers are followed up with telephone calls. Attempts to contact the mother will last about five weeks and calls are made at various times of the day and on different days of the week. Mothers are provided with a reward upon completion of the survey.

South Dakota is also using other resources to promote participation in the PRAMS survey. Efforts include reaching out to the mother's local Women's, Infants and Children Program (WIC) office as well as many community hospitals, clinics, medical associations, newspapers and radio stations throughout the state.

## **The Goal of South Dakota PRAMS**

The South Dakota PRAMS has several goals:

1. Supplement existing birth certificate information
2. Increase awareness of the disparities that exist in the state, determine why they exist, and what can be done to eliminate them; and
3. Provide accurate estimates on what is occurring in the state in terms of maternal and child health.

Specifically, the South Dakota PRAMS hopes to learn about unintended pregnancies, barriers to accessing prenatal care and trends in mother's behaviors and attitudes.

Other states have used PRAMS results to:

- understand how maternal behaviors and experiences correlate with infant health at birth
- develop new maternal and child health programs and modify existing programs
- influence public health policy
- help health professionals incorporate the latest research into current standards of practice
- monitor the progress of local, state and national health objectives

**Results of the South Dakota 2014 and 2016 PRAMS-like survey, along with executive summaries, are currently available on the South Dakota Department of Health website:**

## Colorectal Cancer in South Dakota

South Dakota Cancer Registry, South Dakota Department of Health

The 2015 colorectal cancer data has been released. For 2011-2015, the average number of new colorectal cancer cases per year is 425, and the average number of annual deaths due to colorectal cancer is 164.

### Incidence 2015

Number of cases	
Total	400
Males	216
Females	184
White	372
American Indian	21
Median age at diagnosis	70 yrs
Mode	77 yrs
Age range at diagnosis	8-103 yrs
SD age-adjusted incidence rate	40.0
US SEER age-adjusted incidence rate (2014) *	38.9

### Mortality 2015

Number of deaths	
Total	168
Males	84
Females	84
White	156
American Indian	11
Median age at death	76 yrs
Mode	77 yrs
Age range at death	22-104 yrs
SD age-adjusted death rate	15.7
US SEER age-adjusted death rate (2014) *	14.1

Rates per 100,000 US 2000 Standard Population and SD 2015 Estimated Population

\*2015 US SEER age-adjusted rates not available.

Source: South Dakota Department of Health

The graph at the right displays the Surveillance Epidemiology and End Results (SEER) Summary Stage at diagnosis for 2015 colorectal cancer cases in South Dakota. As shown, over half of the cases were diagnosed at the more advanced stages of regional and distant. Patient survival rates decline when diagnosed at a more advanced stage as illustrated in the table below for cases diagnosed nationally in years 2007-2013.

Source: South Dakota Department of Health

Stage at Diagnosis	5-Year Relative Survival, 2007-2013
Localized	89.9%
Regional	71.3%
Distant	13.9%
Unknown	35.4%

Source: SEER [www.seer.cancer.gov](http://www.seer.cancer.gov)

Diet and physical activity are the most important environmental influences on colorectal cancer. Behavior modification is needed to reduce the risk of developing colorectal cancer. See below for the age-adjusted colorectal cancer incidence rates for the United States and South Dakota for 2001-2014.

### Colorectal Cancer Incidence Rates, US and SD

Rates per 100,000 US 2000 Standard Population and SD Estimated Population  
US rates are provided by SEER [www.seer.cancer.gov](http://www.seer.cancer.gov)

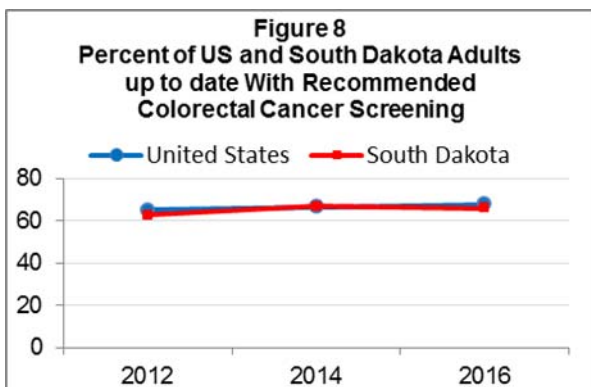

As more South Dakotans participate in recommended colorectal cancer screenings, the mortality rates will decrease. During screenings, precancerous polyps are removed to prevent cancer. The age-adjusted colorectal cancer mortality rates are shown below for the United States and South Dakota for 2001-2014.

### Working Toward the Shared Goal of 80% Screened for Colorectal Cancer by 2018

“80% by 2018” is a National Colorectal Cancer Roundtable initiative to increase the use of recommended colorectal cancer (CRC) screening tests. Over 1,500 organizations have pledged to make this goal a priority. These organizations are working toward the shared goal of 80% of adults aged 50 and older being regularly screened for colorectal cancer by 2018. Visit [nccrt.org/80by2018](http://nccrt.org/80by2018) for tools and resources. Figures 8 and 9 illustrate South Dakota’s progress.

## South Dakota BRFSS Surveillance Brief: Cancer Survivorship

### Background:

The American Cancer Society (ACS) estimates there are 39,330 cancer survivors residing in SD.<sup>1</sup> The National Cancer Institute identifies, “in cancer, a person is considered to be a survivor from the time of diagnosis until the end of life”.<sup>2</sup> However, survivorship is often considered as the period after conclusion of active treatment for survivorship care plan delivery. Cancer survivors are at greater risk for developing secondary cancers and often have unique needs related to long-term treatment effects, follow-up care, and surveillance for reoccurrence. An Institute of Medicine Report identified failures in the U.S. healthcare system in providing coordinated and comprehensive follow-up care for cancer survivors. The report also identified a lack of guidelines and system failures for assisting cancer survivors with the care transition from oncology care and overcoming psychosocial or medical problems that they may face.<sup>3</sup> Survivorship care plans were identified as an opportunity to help improve communication and the quality of care for cancer survivors. Currently, two accreditation programs from the American College of Surgeons – the Commission on Cancer and National Accreditation Program for Breast Cancers – include standards on cancer survivorship care plans.<sup>4</sup>

### Methods:

The South Dakota Behavioral Risk Factor Surveillance System (BRFSS) is a telephone survey of residents aged 18 and older and is conducted as a combined effort between the South Dakota Department of Health (DOH) and the Centers for Disease Control and Prevention. Further details on the SD BRFSS methodology can be found at [doh.sd.gov/Statistics/2016BRFSS/Methodology.pdf](http://doh.sd.gov/Statistics/2016BRFSS/Methodology.pdf).

The full thirteen-question CDC cancer survivorship optional module was included on the 2016 SD BRFSS. This report utilizes data from this optional module to evaluate cancer survivorship care plan receipt, clinical trial participation and other relevant indicators for cancer survivorship.

### Results:

In 2016, 11.8% of South Dakota adults reported ever having cancer in their lifetime, including skin cancer. Among cancer survivors, 84.5% reported having one type of cancer, 13.9% reported having two types and 1.6% reported having three or more. As outlined in Table 1, the cancer type most frequently reported was skin cancer, followed by breast, male reproductive, female reproductive and gastrointestinal. For respondents with two or more cancer types, their most recent type of cancer diagnosis was reported. The mean age at diagnosis was 53, and the age range at diagnosis was from 2 years to 89 years old. When asked to identify who provided the majority of their health care, 54.6% of cancer survivors reported family practitioner and 25.9% reported general practitioner. Most survivors (93.2%) reported having health insurance that covered all or part of their treatment. Clinical trial participation as part of cancer treatment was reported by 4.5% of cancer survivors. Only 4.9% of cancer survivors reported current physical pain due to cancer treatment. Due to a low number of events (LNE), pain control is not able to be reported.

Table 1. Cancer Types Reported, 2016	
Cancer Type	% (95% CI)
Skin	48.7 (42.6-54.9)
Breast	11.8 (8.5-15.2)
Male Reproductive	11.1 (7.2-15.1)
Female Reproductive	10.1 (6.5-13.6)
Gastrointestinal	3.7 (1.7-5.6)
All Others <sup>‡</sup>	Low Number of Events (LNE)

<sup>‡</sup>all others include, but are not limited to, urinary, head/neck, leukemia and thoracic

A cancer survivorship care plan consists of both a written cancer treatment summary and written follow-up summary. As shown in Table 2, 53.2% of cancer survivors reported receipt of written or printed instructions from a doctor, nurse or other health professional about where they should return or who they should see for routine cancer check-ups after completing treatment for cancer. Only 38.9% of cancer survivors reported receipt of a written cancer treatment summary. Non-significant differences by age group were found; those 65 and older were less likely to receive a written cancer treatment summary and written summary of routine cancer check-ups than cancer survivors ages 18-65. No differences between males and females were noted for receipt of a written summary of routine cancer check-ups; however, a lower rate was reported for receipt of a written cancer treatment summary among male cancer survivors compared to female cancer survivors (33.5% vs. 42.9%). While not significant, receipt of both a written cancer treatment summary and written summary of routine cancer check-ups was higher among those with a household income above \$25,000.

Cancer survivors were also asked if they were ever denied health insurance or life insurance coverage because of their cancer, with 8.9% of cancer survivors reporting being denied coverage. Rates were significantly higher among cancer survivors ages 18-64 vs. 65 and older ( $p=0.02$ ).

<b>Table 2. Demographic comparison for survivorship care plans and insurance denial, 2016 SD BRFSS (N=803) *P&lt;0.05</b>			
	<b>Received a Written Cancer Treatment Summary</b> % (95% CI)	<b>Received a Written Summary of Routine Cancer Check-ups</b> % (95% CI)	<b>Denied Health or Life Insurance† Due to Cancer Diagnosis</b> % (95% CI)
<b>Total</b>	38.9 (33.0-44.8)	53.2 (47.2-59.2)	8.9 (5.2-12.6)
<b>Age</b>			
18-64	41.2 (31.5-50.9)	59.6(49.9-69.2)	13.4 (6.1-20.6)*
65+	37.2 (29.8-44.6)	48.0 (40.6-55.3)	5.4 (2.3-8.5)
<b>Gender</b>			
Male	33.5 (24.5-42.5)	53.1 (43.8-62.4)	LNE
Female	42.9 (35.2-50.7)	53.3 (45.4-61.1)	9.0 (4.5-13.4)
<b>Household Income</b>			
<\$25,000	32.4 (18.0-46.8)	45.7 (31.2-60.3)	LNE
\$25,000-\$49,999	42.5 (30.7-54.4)	54.9 (43.7-66.0)	LNE
\$50,000+	40.2 (30.9-49.5)	57.9 (48.2-67.6)	9.8 (4.4-15.1)
†Insurance also includes Medicare, Medicaid and other types of state health programs			

## Conclusions:

Based on the findings from this report, survivorship care plans were being provided at a rate exceeding the Commission on Cancer standards for 2016.<sup>4</sup> However, given the importance of ensuring coordinated care for cancer survivors, cancer treatment centers should continue to expand service provision to include all eligible survivors. The SD Survivorship Program continues to work with cancer treatment centers in South Dakota to support the provision of survivorship care plans as well as evaluate effectiveness. The findings in this report should be used to improve cancer survivorship services in SD.

## South Dakota Strategic Plan 2015-2020—Smoking

Reduce the percentage of adults that currently smoke from 18.6% in 2014 to 14.5% by 2020

South Dakota Percent	South Dakota 2020 Target	U.S. Percent
18.1% (2016)	14.5%	17.1% (2016)

### Significance:

Cigarette smoking is the single most preventable cause of death and disease in the U.S. Cigarette smoking causes approximately 1,000 deaths each year in South Dakota – nearly three people each day. Half of all long-term smokers die prematurely from smoking-related causes. The health consequences of tobacco use include heart disease, multiple types of cancer, lung and respiratory disease, negative reproductive effects, and the worsening of chronic health conditions such as diabetes and asthma.

Tobacco use costs South Dakota \$373 million in health care expenditures and another \$282.5 million in lost productivity each year. The portion of this cost covered by the state Medicaid program is \$70.2 million. These amounts do not include health costs caused by exposure to secondhand smoke, smoking-caused fires, smokeless tobacco use, or cigar/pipe smoking.

Even though tobacco use rates are declining among the population overall from 23.1% in 2011 to 18.1% in 2016, the rates are still troubling among several groups who are disproportionately affected by tobacco.

- According to CDC, 16.4% of young adults (age 18-24, 2015) smoke nationwide vs. 22.6% in South Dakota (2012-2016)
- American Indians in South Dakota are much more likely to have smoked cigarettes than whites – 44% vs. 17% (2014-2016)
- The Medicaid population smoking prevalence is 44% vs. the overall state rate of 20% (2012-2016)
- The rate of adult pregnant women smoking in South Dakota is 13.6% and the US rate is 8.4% (2014). Parental smoking is a risk factor for SIDS, complications from prematurity and low birth weight, and other pregnancy problems. (2016)

Significant strides in smoking prevalence have been made in high school youth. Smoking prevalence among U.S. high school youth is at an all-time low at 10.8% and South Dakota even lower at 10.1%. Most smokers begin smoking as children and almost all first tobacco use occurs before age 18.

**Definition:** Percent of adults who currently smoke cigarettes

**Data Source:** Behavioral Risk Factor Surveillance System (BRFSS)

### Statistical Trend:

Adult Smoking Prevalence, 2011-2016

**Date Last Updated:** 06/29/2018

## Kindergarten Vaccination Rates, 2017–2018 School Year — Keeping Kids Healthy

Vaccination is regarded as one of the top 10 greatest achievements of public health in the last century. The successful vaccination of each U.S. birth cohort with the current childhood immunization schedule prevents approximately 42,000 deaths and 20 million cases of disease.<sup>1</sup> Safeguarding places where children gather, like schools and daycares, requires a commitment to health from parents, administrators, clinicians and the health department. The common goal is to prevent disease outbreaks from occurring by ensuring high levels of vaccination for conditions like measles, mumps, rubella, diphtheria, pertussis, varicella, polio and hepatitis A.

For the 2017–2018 school year, 380 South Dakota schools with kindergarten classes submitted vaccination audit data to the South Dakota Department of Health. South Dakota’s overall coverage rate was 96.6% for the MMR (measles, mumps, rubella) vaccine, 95.9% for the DTaP (diphtheria, tetanus, pertussis) vaccine, 95.7 percent for the varicella (chicken pox) vaccine and 96.4% for the polio vaccine. All coverage rates met the Healthy People 2020 goal of 95% coverage for children in kindergarten, and exceeded most recent national rates.<sup>2</sup> One concerning trend has been the incremental increase in the overall exemption rate from 1.8% in 2013 to 2.2% in 2017.

## 6th Grade Vaccination Rates, 2017–2018 School Year — Keeping Kids Healthy

For the 2017–2018 school year, 320 South Dakota schools with 6th grade classes submitted vaccination audit data to the South Dakota Department of Health. South Dakota’s overall coverage rate was 95.5% for Tdap vaccine and 95.1% for meningococcal vaccine. The overall exemption rate was 2.0%, a slight increase from 1.9% in the 2016-2017 school year.

**South Dakota Department of Health – Infectious Disease Surveillance**

**Selected Morbidity Report, 1 January – 30 June 2018**

Provisional Data | <http://doh.sd.gov/statistics/surveillance/>

	Disease	2018	5-year median	Percent change
<b>Vaccine-Preventable</b>	Diphtheria	0	0	-
	Tetanus	0	0	-
	Pertussis	18	10	+80%
	Poliomyelitis	0	0	-
	Measles	0	0	-
	Mumps	0	0	-
	Rubella	0	0	-
	<i>Haemophilus influenza</i> (invasive) all types	9	-	-
	Meningococcal disease, invasive	0	1	-100%
	Pneumococcal disease, invasive	55	63	-13%
<b>Sexually Transmitted</b>	HIV infection	10	19	-47%
	Hepatitis B, acute	0	2	-100%
	Chlamydia	2,238	2,130	+5%
	Gonorrhea	780	503	+55%
	Syphilis, early	27	25	+8%
<b>Tuberculosis</b>	Tuberculosis	7	7	+0%
<b>Enteric</b>	<i>E. coli</i> , Shiga toxin-producing	99	21	+371%
	Campylobacteriosis	279	161	+73%
	Salmonellosis	88	107	-18%
	Shigellosis	12	16	-25%
	Giardiasis	42	51	-18%
	Cryptosporidiosis	87	57	+53%
	Hepatitis A	0	0	+0%
<b>Vector-borne</b>	Rabies, animal	10	12	-17%
	Tularemia	2	6	-67%
	Spotted fever rickettsiosis	11	2	+450%
	Malaria, imported	5	3	+67%
	Lyme disease	4	3	+33%
	West Nile Virus	0	6	-100%
<b>Other</b>	Legionellosis	7	4	+75%
	Hepatitis C, acute and chronic	286	303	-6%
	Zika virus	0	-	-
	Additional reports include: Carbapenem Resistant Enterobacteriaceae (22); Chicken Pox (18); Coccidioidomycosis (1); Cyclosporiasis (8); Ehrlichiosis (4); Hepatitis B, chronic (28); MRSA, invasive (80); Q fever (4); Vibriosis (7).			

Communicable diseases are mandatorily reportable by physicians, hospitals, laboratories, and institutions. The **Reportable Diseases List** is found at <https://doh.sd.gov/diseases/infectious/Reporting.aspx> or upon request. Diseases are reportable by telephone, fax, mail, website or courier.

**By Secure Website:** <http://sd.gov/diseasereport>

**By Telephone:** 800-592-1861 or 605-773-3737 After hours for Category I diseases and during normal business hours

**By Fax:** 605-773-5509

**By Mail:** DOH – Office of Disease Prevention, 615 East 4th Street, Pierre, SD 57501, in a sealed envelope marked "Confidential Medical Report"

3,580 copies of this Bulletin were printed by the Department of Health at a cost of \$0.\_\_\_\_ per copy.
